Electricity

Key Vocabulary		Key Knowledge	
electricity	The flow of an electric current or charge through a material, e.g. from a power source through wires to an <mark>appliance</mark> .	Lightning and static electricity are examples of electricity occurring naturally but for us to use electricity to power appliances, we need to make it.	
generate renewable	To make or produce. A source of electricity that will not run out. These include solar, nuclear, geothermal, hydro and wind.		
non-renewable	This source of energy will eventually run out and so will no longer be able to be used to make electricity . These include fossil fuels — coal, oil and natural qas.		
appliances	A piece of equipment or device designed to perform a particular job, such as a washing machine or mobile phone.		
battery	A device that stores electrical energy as a chemical.		

Electricity

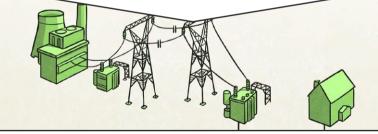

Key Vocabulary

circuit

A pathway that electricity can flow around. It includes wires and a power supply and may include bulbs, switches or buzzers.

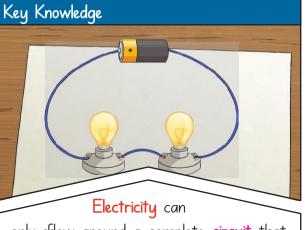

There are two types of electric current.

Mains **electricity**: power stations send an electric charge through wires to transformers and pylons. Then, underground wires carry the electricity into our homes via wires in the walls and out through plug sockets.

Battery electricity: batteries store chemicals which produce an electric current. Eventually, even rechargeable batteries will stop producing an electric

only flow around a complete **circuit** that has no gaps. There must be wires connected to both the positive and negative end of the power <u>supply/battery</u>. Switches can be used to open or close the circuit. When off, a switch 'breaks' the circuit to stop the flow of electrons. When the switch is on, the circuit is complete, and the electrons are able to flow around the circuit.

A conductor of **electricity** is a material that is made up of free **electrons** which can be made to move in one direction, creating an electric current. Metals are good conductors. Electrical insulators have no free **electrons** and so no electric current can be made. Wood, plastic and glass are good insulators.
